Welcome

This resource

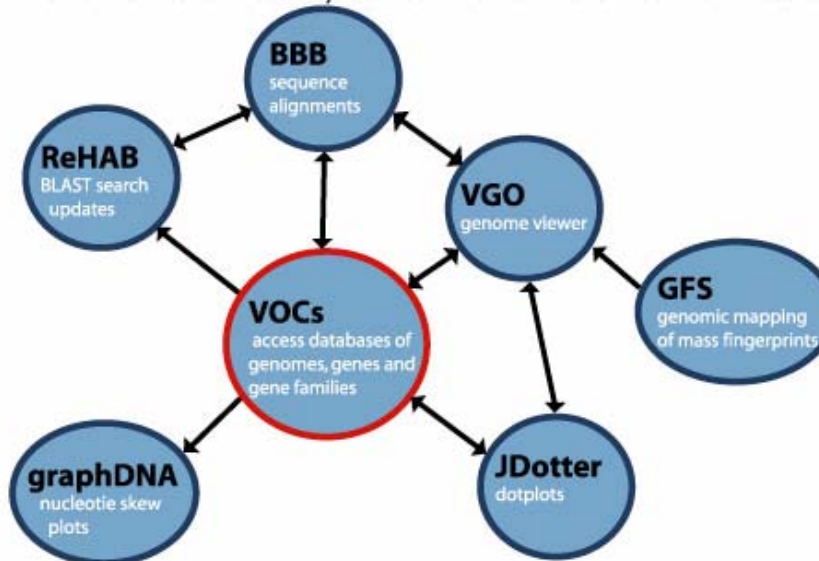

Provides access to viral genomes and a variety of tools for comparative genomic analyses. At the heart of the system is VOCs (Virus Orthologous Clusters), a database with built-in tools that allows users to retrieve and analyze the genes, gene families, and genomes of 11 different virus families. The database is the source of information for other programs of the workbench for whole genome alignments, genome display, or gene/protein sequence analysis. Many of these tools can also be used with user-provided sequence data. The workbench tools are Java-based and user-friendly to allow all users, regardless of computer skill-level, to access and analyze the data.

To start

There are two ways to start an application from the workbench:

- Select an application, and then choose its associated database when the application starts.
- Select a database, and then start an application using the afore-selected database.

The figure below shows the interconnectivity between the workbench tools and databases at VBCa

Databases

dsDNA viruses

JDotter: Java Dot Plot Alignments

- Java front end to Dotter

- Sonnhammer,E.L. and Durbin,R. (1995) A dot-matrix program with dynamic threshold control suited for genomic DNA and protein sequence analysis. *Gene*, **167**, GC1-GC10

- Platform independent (client-server)

- Preprocessed dotplots

- Local screen refreshing

- Zoom-replotting performed on server

- Displays gene annotations from VOCs

Base-By-Base: Genome Alignment

- Java MSA editor
 - Genes, proteins, genomes
 - Input from Clustal, Tcoffee, MUSCLE etc.
 - Uses XML format for annotations and comments
- Displays differences between sequences
- Finds all differences between genomes
 - Uses annotations from GenBank/VOCs
 - Lists diffs for each gene and 5' region

Sequence alignment view showing differences between SARS coronavirus sequences (SZ3, Tor2, Urbani) and a reference sequence. The alignment is displayed in a multi-frame view (Frame 1, Frame 2, Frame 3) with a scale bar indicating positions 18, 1900, and 1920. The sequences are color-coded by amino acid type: L (red), S (blue), D (green), Q (yellow), F (orange), R (purple), A (pink), H (light blue), M (dark blue), C (cyan), T (light green), G (dark green), P (brown), K (dark purple), N (grey), I (dark red), V (dark blue), Y (orange), Q (yellow), I (dark red), N (grey), F (orange), F (orange), A (pink), H (light blue), T (light green), C (cyan), S (blue), K (dark purple), P (brown), L (red), N (grey).

GraphDNA: DNA Skew Graphing

Orthologs

[Similarity Search](#) | [Ortholog Comparison](#)

search for shared gene orthologs

Select the appropriate parameters and press the **Submit** button to get the set of all similar genes (orthologs) shared between the viruses in your list.

Virus List	
Select viruses: (hold down the Ctrl key to make multiple selections)	<div>Tick-borne encephalitis virus strain Vasilchenko</div> <div>Variola major virus strain Bangladesh-1975</div> <div>Variola major virus strain India-1967</div> <div>Variola minor virus strain Garcia-1966</div> <div>Venezuelan equine encephalitis virus strain 243937</div>
Protein BLAST comparisons between the above list of viruses should have:	
an E value less than	<input type="text" value="1e-4"/>
and an alignment containing at least	<input type="text" value="90"/> % identical residues.

Matches are based on a BLAST search of all virus proteins in the VBRC database searched against the same protein set (an all-all search). BLAST parameters used include an E value cutoff of 0.0001 and no filtering of the query sequence.

Note that lowering the E value cutoff, or raising the Percent Identical residues value will result in fewer hits - the BLAST search is more stringent.

- Mouse over a point to view a tooltip listing the represented genes.
- Click on a point to view the BLAST comparison results.

Zoom In

**Gene Synteny of
Variola major virus strain Bangladesh-1975
vs.
Variola minor virus strain Garcia-1966**

Generate GIF and SVG files of this plot.

E Value Cutoff

GenAlignRefine

- Refinement of multiple whole-genome alignments
- An initial alignment is generated with existing tools
 - Multi-LAGAN
 - CHAOS/DIALIGN
- Gapped (“fuzzy” regions) of the alignment are identified and refined (each to own compute node) to improve the overall quality of the entire alignment
 - Utilizes a genetic algorithm

Welcome

This resource

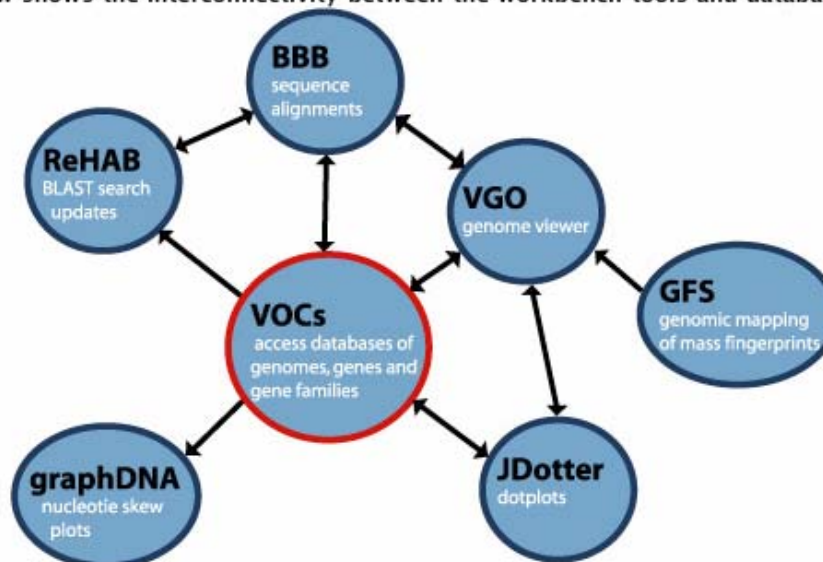

Provides access to viral genomes and a variety of tools for comparative genomic analyses. At the heart of the system is VOCs (Virus Orthologous Clusters), a database with built-in tools that allows users to retrieve and analyze the genes, gene families, and genomes of 11 different virus families. The database is the source of information for other programs of the workbench for whole genome alignments, genome display, or gene/protein sequence analysis. Many of these tools can also be used with user-provided sequence data. The workbench tools are Java-based and user-friendly to allow all users, regardless of computer skill-level, to access and analyze the data.

To start

There are two ways to start an application from the workbench:

- Select an application, and then choose its associated database when the application starts.
- Select a database, and then start an application using the afore-selected database.

The figure below shows the interconnectivity between the workbench tools and databases at VBCa

Databases

dsDNA viruses

[Adenoviridae](#)
[Baculoviridae](#)
[Herpesviridae](#)
[Poxviridae](#)

+ ssRNA viruses

[Coronaviridae](#)
[Flaviviridae](#)
[Togaviridae](#)

- ssRNA viruses

[Arenaviridae](#)
[Bunyaviridae](#)
[Filoviridae](#)
[Paramyxoviridae](#)
